INTRODUCTION

Scope

This report provides site and soil assessment for on-site effluent disposal at the applicant's proposed new subdivision. The report focuses on the land in proximity to the proposed building envelope. Other areas within the proposed subdivision may also be suitable for on-site effluent disposal pending further investigation at building DA stage. A five-bedroom dwelling is assumed. An Aerated Wastewater Treatment System (AWTS) is proposed.

An AWTS coupled with surface or subsurface irrigation provides a suitable form of effluent treatment for the site and soil characteristics of the land in question. The management recommendations include the size and location of the proposed irrigation area.

SITE CHARACTERISTICS

The terrain of the site comprises a gently inclined upper slope of 5-8 degrees overlying fossiliferous mudstone or siltstone. The slope across the proposed irrigation area has a linear divergent configuration ensuring that runoff does not concentrate within the site. The soil at the site is an imperfectly drained Dermosol within the Binalong soil landscape. It comprises sandy clay loam topsoil horizons to 60cm, overlying a light sandy clay subsoil to 70cm. Sedimentary rock underlies the soil profile.

Council area Yass Valley
Owner/developer Togias
Area: 8 ha

Site plan attached Yes
Photograph attached Yes

Intended water supply Rainwater

Expected wastewater 720

quantity (litres/day) (Assumed 5 bedroom dwelling, potentially

housing 6 occupants generating design flows

of 120L/person/day = 720 litres/day)

Local experience Aerated wastewater treatment systems

provide adequate treatment of effluent on

appropriate soils.

SITE ASSESSMENT

Climate Warm to hot summers with a high evaporative deficit. Cool to

cold winters with a small evaporative deficit

Where appropriate:

Rainfall water balance calculated Yes
Land application area calculated Yes
Wet weather storage area calculation attached NA

Flood potential:

Land application area above 1 in 20 year flood level

Land application area above 1 in 100 year flood level

Yes
Electrical components above 1 in 100 year flood level

Yes

Exposure Well exposed with no shade

Slope Linear divergent Landform Upper slope

Run-on See management prescriptions

Seepage None

Erosion Potential Low with adequate vegetation

Site Drainage Imperfectly drained
Fill None in application area

Groundwater:

Horizontal distance to groundwater well

used for domestic water supply >250m

Buffer distance from wastewater management system to:

Is there sufficient land area for:

Application system (including buffer distances)

Reserve application system (including buffer distances)

Yes

Surface rocks

Outcropping upslope of effluent application area

SOIL ASSESSMENT

Depth to bedrock or hardpan 70cm Depth to soil water table >70cm

Hydraulic loading rate

Soil structure Weak to moderately structured topsoil

Moderately structured subsoil

Soil texture Sandy clay loam topsoil

Light sandy clay subsoil

Permeability category (4) 0.5-1.5m/day in topsoil

0.06-0.12m/day in subsoil (5)

Hydraulic loading recommended

for irrigation system

1.6mm/day irrigation

Coarse Fragments None in topsoil

5% to 10mm in subsoil

Bulk Density Estimate 1.5 in topsoil

Estimate 1.4 in subsoil

Ph (1:5 Water) Topsoil 4.8

Subsoil 4.7

Electrical conductivity (dS/m) Topsoil .07

Subsoil .02

None

Geology & soil landscape survey

Presence of discontinuities

Presence of fractured rock

Soil landscape reference Binalong

Dispersiveness None in topsoil EAT 8

None in subsoil EAT 5(2)

Extent of fracture unknown

SYSTEM SELECTION

Consideration of connection to a centralised sewerage system

Nearest feasible connection point

Potential for future connection to centralised sewerage

None

Potential for future connection to reticulated water

None

Type of land application system best suited to site:

Surface or subsurface irrigation

Reason Suits site and soil characteristics. Rock at 70cm

precludes subsoil absorption in trenches or beds unless greater depths of suitable soil are found in

further investigation at dwelling DA stage.

Type of treatment system best suited to site and application system:

Aerated wastewater treatment system

Reason Superior standard of treatment for site and soil

conditions.

GENERAL COMMENTS

Are there any specific environmental constraints?

None provided 40m setback to drainage line is observed and steeper upslope areas with outcropping rock are avoided.

Are there any specific health constraints?

None

MANAGEMENT PRESCRIPTIONS

Aerated wastewater treatment systems treat effluent to an improved, or secondary standard, reducing any impact on groundwater and making available water for landscaping and other purposes. The following prescriptions are site specific and must be strictly adhered to, in order to maximise water and nutrient uptake, and thus minimise runoff and seepage.

The AWTS must be accredited by NSW Health.

An irrigation area of 450 m^2 should be determined within the area shown as suitable in Figure 1.

The treated effluent may be applied by surface irrigation provided slope does not exceed 6 degrees. Surface sprays must be of the large droplet type that do not produce aerosols, and are to be regularly rotated through-out the area to evenly spread hydraulic and nutrient loads.

The treated effluent may also be applied by sub-surface irrigation and must be done so if slope exceeds 6 degrees.

Auto flush return to the tank should be installed to ensure flocculants in the lines are recycled back to the tank. Pressure compensating dripper heads to be used. Vacuum breakers or air release valves to be installed at highest point in irrigation field, to prevent migration of soil into irrigation lines. Irrigation laterals to be installed on the contour at 100mm depth and at nominal 1000mm spacing. A single disc filter of nominal 100mm diameter (85mm internal) to be installed upstream of irrigation system. Filter to be cleaned at quarterly service intervals.

House area and rainwater tank runoff to be directed clear of the effluent application area.

The irrigation area must not be disturbed by any building activity such as stockpiles of excavated material or vehicle traffic. Livestock to be excluded from the site.

Detergents should be selected for low levels of phosphorus and sodium. (See appendix 3)

Fig 1. Area suitable for effluent application

WATER BALANCE

A water balance model is helpful in assessing the sensitivity of the design to various input and output characteristics.

Based on a potential quantity of 720 litres/day of wastewater, spread across 450 m² of irrigation area, the effluent application rate of 1.6mm/day results in a moisture deficit in all months of the year. Importantly, the deficit is theoretical and it should be noted that saturation is possible at any time following periods of extended wet weather.

The application rate of 1.6mm/day is comparatively conservative, against the rate of 3.5mm/day for a clay loam determined from table M1 from AS1547:2012. A conservative rate has been applied due to the lower P sorption capacity of the sandy clay loam soil.

NUTRIENT BALANCE

The nutrient balance examines the discharge of nitrogen and phosphorus against the capacity of plants and soil to assimilate those nutrients. Excess nutrients may eventually impact upon watercourses via surface run-off or groundwater.

| | _ | | | | | | -1.7928 | kg/year | | |
| | | | Minimum Bu | ffer Required | for excess nut | rient | 0 | m² | | |

720 litres/day wastewater quantity at 30mg/l total N concentration = 7.9 kg Nitrogen discharged per year, applied over an irrigation area of $450 \text{ m}^2 = 176 \text{ kg/ha/yr}$.

A mix of existing native and improved grasses should provide a rate of nitrogen uptake of around 180kg/ha/yr at this location.

Total nitrogen loss to soil processes should account for 35kg/ha/yr. Therefore the discharge of nitrogen should be balanced by plant uptake and soil processes.

Phosphorus Loading

720 litres/day wastewater quantity at 10 mg/l of P

- = 2.6 kg P discharged per year, applied over an irrigation area of 450m²
- = 58 kg/ha/vr.

Native & improved grasses should provide a rate of P uptake of around 20kg/ha/yr.

Balance of 38kg/ha/yr. applied to P sorption capacity of soil; P sorption capacity of in-situ soil 2720kg/ha. ¹

Lifetime of irrigation area 72 years in terms of P sorption capacity.

LAUNDRY PRODUCTS RESEARCH

Laundry products were purchased by *Lanfax Labs* from supermarkets in Armidale, NSW and a number of boutique products were provided by manufacturers. A total of 41 liquids and 54 powders were tested by mixing each product at the manufacturer's recommended dose for either front loading or top loading automatic washing machines. The dose was calculated at the full cycle load, that is 75 L for front loaders and 150 L for top loaders. The full cycle accounts for the water used in the wash, spin, rinse, deep rinse and spin rinse cycle. The quantities of 75 L for front loaders and 150 L for top loaders were taken from averaged rates for those machines (Patterson, 2004).

Each sample was mixed with cold (20°C) deionised water (to replicate good quality rainwater). Where town water supplies are used, the values reported for sodium concentrations may increase because of sodium in the reticulated water – that will vary from location to location, usually higher in inland than coastal towns. Each sample was shaken for 30 minutes to replicate the washing action.

The concentrations of sodium and phosphorus (and other elements) were measured on the samples using Inductively Coupled Plasma (ICP) technology in accordance with current Good Laboratory Practices at Lanfax Labs.

Only sodium (g/wash) and phosphorus (mg/L) are reported in the graphs presented here.

Additional information on this unique research may be obtained at: www.lanfaxlabs.com.au/laundry.htm

Other papers on laundry detergents can be found at: www.lanfaxlabs.com.au/publications.html

HOW TO READ THE GRAPHS

Each product is represented by two bars: the top bar (if present) shows the phosphorus concentration (mg/L); while the lower bar shows the sodium load (g/wash). The graph is arranged in ranked order of sodium load. Figure F1 is for 54 detergents at the front loader rate, Figure T1 is for 89 detergents at the top loader rate.

Sodium Load

For all on-site systems that apply the effluent by surface or subsurface application, the levels of sodium in the discharge are critical to long term absorption. Choose the product with the lowest sodium load (g/wash). Levels above 20 g/wash are likely to be detrimental to plants and the soil although plant tolerance and soil types will vary. The shorter the bar, the lower the load. When in doubt, choose the lower sodium load.

The detergents with long sodium bars (greater than 20 g/wash) should not be thrown onto your favourite garden as the sodium may be detrimental to the plants. High pH (see the website for pH data) is also detrimental to plants and soil. The pH of liquids (average pH 8) is generally lower than pH of powder detergents (average pH 10.5).

Phosphorus Concentration

The choice of a suitable level of phosphorus in the greywater (laundry water discharge) will depend upon the soil type and the use of the effluent. In some soils, phosphorus is not a real concern because of the natural ability of the soil to immobilize the phosphorus and limit its leaching from the disposal site. In other soils, phosphorus is likely to build up to high levels and leach from the soil. It is preferable to choose the lower phosphorus values as well as the low sodium values. The load of phosphorus for each product is available in the website data.

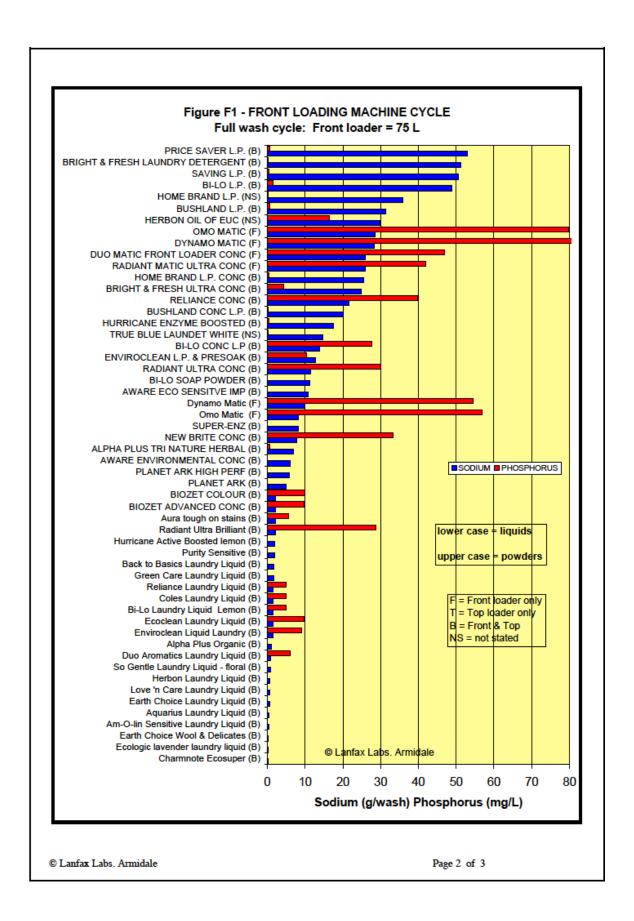

©Copyright Restriction

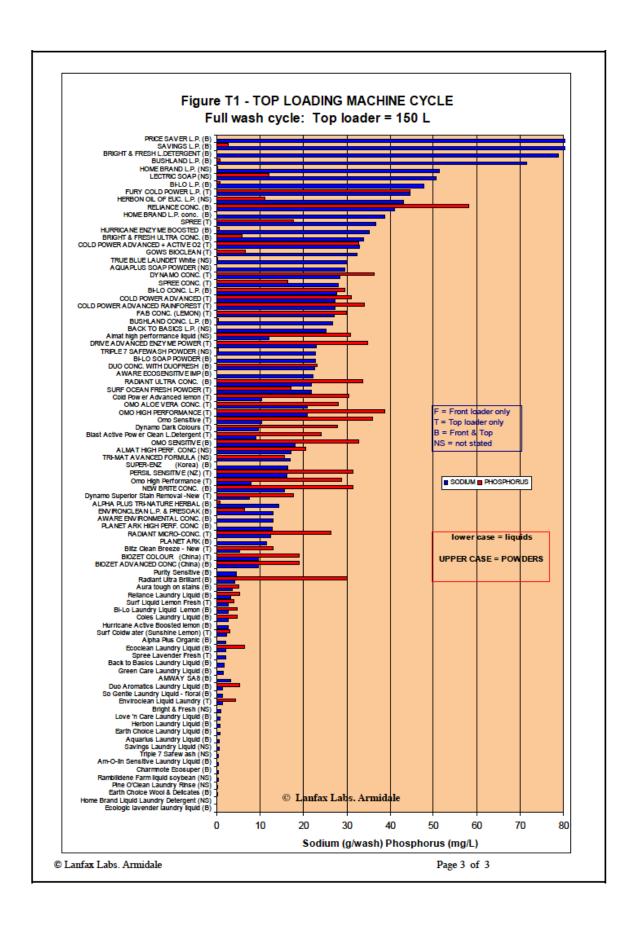

This material may only be reproduced in full (three pages) for educational purposes. None of the graphs should be construed as an endorsement of one product over another, or that one product is superior or inferior to another. The data are presented as measurements of fact, ranked in order of sodium.

This research was funded by Lanfax Labs and was independent of any manufacturer or other organisation.

Caution: Formulations may have changes since these products were purchased in 2005.
